PROFESSIONAL SUMMARY

2025 BCA graduate with an unusually advanced engineering scope for an early-career developer. Architected five production-grade systems at AutoShipp — a multi-tenant B2B SaaS platform — and led a two-person engineering team by designing custom AI agent workflows, structured development plans, and agent rule sets that directed how the team worked. Delivered zero-downtime database migrations and production data pipelines that completed with zero data loss. Builds production AI systems using RAG, LLM orchestration, and vector search — architected for real deployment, not tutorials. Combines full-stack development, system architecture, and AI-augmented team leadership.

WORK EXPERIENCE

Full-Stack Engineer & Architect | **AutoShipp — Multi-tenant E-commerce SaaS, Startup** | Mar 2025 – Jun 2025

Technical Leadership & Engineering Workflow

- Designed and operated a two-AI engineering workflow system for a two-person team: a Project Planner AI (using PROJECT_ASSISTANT_RULES_V2) that analysed architecture reports, generated implementation plans, and produced structured prompts — and a Coding Agent AI (governed by separate rule sets: github-rules, security-checklist, handover-rule, session-ended-rules, test-rules) that executed implementations. This system governed the full development lifecycle from architecture to code review to deployment gate.
- Created structured development plans assigning workstreams and tasks between team members — translating architecture documents into concrete, sequenced engineering deliverables with defined ownership.
- Authored eight custom rule files governing agent behaviour: evidence-first review, no-assumption policy, discovery-before-implementation, reuse-first rule, git safety boundaries (no push/deploy without explicit approval), and improvement-injection discipline — ensuring every AI-generated output met architecture standards before acceptance.

System Architecture — Designed End-to-End

- Architected the entire AutoShipp SaaS core platform: NestJS backend (Organizations, Identity/RBAC, Marketplace, Billing & Wallet, Communication, Shopify Integration, Intelligence modules), 80+ table PostgreSQL schema, and Next.js frontend — documented across 44 formal AES specification documents, Mermaid ER diagrams, and a complete API suite.
- Designed the Universal AI ChatBot platform: multi-channel (WhatsApp + Instagram) with LLM router across Gemini, Groq, Mistral, and OpenAI; CommerceEngine, CartEngine, RecommendationEngine, ReturnEngine, PersonaEngine, SafetyEngine; WebSocket ConversationGateway with OpenTelemetry observability.
- Designed the Fit Intelligence engine: multi-tenant product recommendation system with A/B experimentation, governance, analytics, replay partitioning, Shopify catalog sync pipeline, circuit-breaker, and feature-flag infrastructure.
- Architected Verification Hub: provider-agnostic OTP/challenge platform using clean architecture (domain → application → infrastructure → SDK → admin portal) with tenant config, replay queue, audit logging, and telemetry.
- Designed Clip Farm from scratch: creator-economy platform with campaign management, submission validation, leaderboard, Razorpay payout integration, BullMQ view-sync and settlement jobs, and a Prisma/PostgreSQL data layer.
- Conducted a structured GoKwik vs AutoShipp competitive analysis across 10 GoKwik products — mapping feature parity, identifying strategic gaps, and producing R&D documentation adopted as input to the AutoShipp product roadmap.

Production Engineering — Implemented & Shipped

- Executed zero-downtime PostgreSQL schema migration across 80 tables: feature-flag-controlled dual writes, schema parity validation, and Neon DB snapshots before every structural change — completed with zero data loss and zero service interruption.
- Built a transactional Shopify customer migration pipeline: paginated extraction of 7,528 records, checkpoint/resume architecture, rollback handling, and source-to-destination reconciliation — migration completed with zero record loss.
- Implemented JWT auth context resolver gated by feature flag FF_PLATFORM_AUTH_READ_CUTOVER — enabling fully reversible auth cutover and incremental RBAC migration without breaking live traffic.
- Integrated WhatsApp Cloud API in a multi-tenant setup: HMAC-validated webhooks, tenant-scoped message routing, Redis-based deduplication, and Conversation Gateway — under a single Meta App serving multiple business accounts.
- Analysed live WhatsApp campaign (2,900 messages, ~1,500 reads, 9 matched orders) for client MomzCradle; calculated read-to-order rate 0.67% and revenue per message ₹9.51 — findings used directly to inform campaign strategy decisions.

PERSONAL PROJECTS

NeuroVault — AI Knowledge Platform — Next.js · TypeScript · Node.js · MongoDB · Supabase pgvector · Redux Toolkit · Redis · BullMQ · AWS S3
GitHub: github.com/abdulbasithibnhanifa/NeuroVault

- Built a complete RAG pipeline: document ingestion → MiniLM vector embeddings → pgvector storage → semantic retrieval → streaming LLM response — multi-LLM support (Gemini, Claude, Llama) with knowledge graph visualisation and async BullMQ-based processing for non-blocking ingestion.

DevDesk — MERN Project Management System — MongoDB · Express.js · React.js · Node.js · JWT

GitHub: github.com/abdulbasithibnhanifa/DevDesk | Live: dev-desk-app.vercel.app

- Full-stack project and ticket management platform with security-first auth: JWT + HttpOnly cookies + refresh token rotation; Axios interceptor for automatic token refresh; optimised RESTful API and MongoDB data modelling throughout.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript

Frontend: React.js, Next.js, Tailwind CSS, Redux Toolkit

Backend: Node.js, Express.js, NestJS, Prisma ORM, REST APIs, WebSockets, BullMQ, Webhooks

Databases: PostgreSQL, MongoDB, Supabase (pgvector), Redis, JSONB, SQL

AI Engineering: RAG, Vector Embeddings (MiniLM), Semantic Search, LLM Integration (Gemini, Claude, Llama, Groq), Multi-LLM Routing, Streaming, AI Agent Workflow Design

Auth & Security: JWT, HttpOnly Cookies, Refresh Token Rotation, RBAC, HMAC Validation, Feature-Flag Auth Cutover, NextAuth

Architecture: Multi-tenant SaaS, Clean Architecture, Domain-Driven Design, Event-Driven Systems, Zero-downtime Migrations, Dual-Write Strategy, System Design

Integrations: Shopify (Customers, Products, Webhooks, OAuth, HMAC), WhatsApp Cloud API (Meta), Shiprocket, ShipXpeed, Razorpay

DevOps & Tools: Git, GitHub, Vercel, Render, AWS S3, GitHub Actions, Cloudflare, Sentry, Postman

EDUCATION

Bachelor of Computer Applications (BCA) — Kamaraj University College, Madurai | 2022 – 2025

LANGUAGES

Tamil (Native) | English (Professional)
